

# Weight Gain with Cancer Treatment

Sometimes patients gain weight with cancer treatments. This weight gain may be caused by some medicines, hormone therapy or chemotherapy. Some medicines cause the body to retain water. Talk to your doctor if you notice any weight gain.

**Do not** go on a weight loss diet without talking to your doctor first. Your doctor or dietitian will help you plan ways to manage your weight gain. Eating healthy meals and drinking liquids will help you feel better during treatment.

## Try these tips to manage weight gain:

- Choose lean cuts of meat such as chicken, turkey, fish and lean beef.
- Choose low fat dairy products such as fat free (skim) milk, 1% milk, and low fat or fat free cottage cheese or yogurt.
- Eat plenty of fruits and vegetables.
- Avoid high fat, high calorie snacks such as chips, cookies, candy and ice cream. Instead, snack on graham crackers, dried fruit or popcorn.
- Avoid using added fats such as salad dressings, margarine, butter, mayonnaise and gravy. Use low fat versions.
- Use low fat cooking methods such as broiling, baking and steaming to cook foods. Use nonstick pans so that no added fat is needed.
- Stay active and exercise to burn off the extra calories and help you feel better.

**Talk to your doctor, nurse or dietitian about dealing with any eating problems you may have.**
